

Abstract

The hot medicinal compress apparatus is a therapeutic and hearth care medical device which has heating, medicament and rolling functions. It includes a heater (2) and a cartridge (3) carrying a medicinal compress layer. The heater (2) includes a heating
5 element and a heat conducting tube (4) in which the heating element is mounted and at both ends of which a front round step member (10) and a rear round step member (10') having a through hole are respectively arranged; at another end of the front round step member (10), a washer and a demountable baffle ring (18) are provided and fixed by a screw nut (12), while at another end of the rear round step member (10'), a handle (1)
10 is arranged, in which a through hole is provided and on which a control switch is mounted. The cartridge (3) is comprised of a metal tube (17) and a medicinal compress layer which is wrapped around the metal tube (17).
